

The mode of action of blocking antibodies can be recapitulated with small molecules

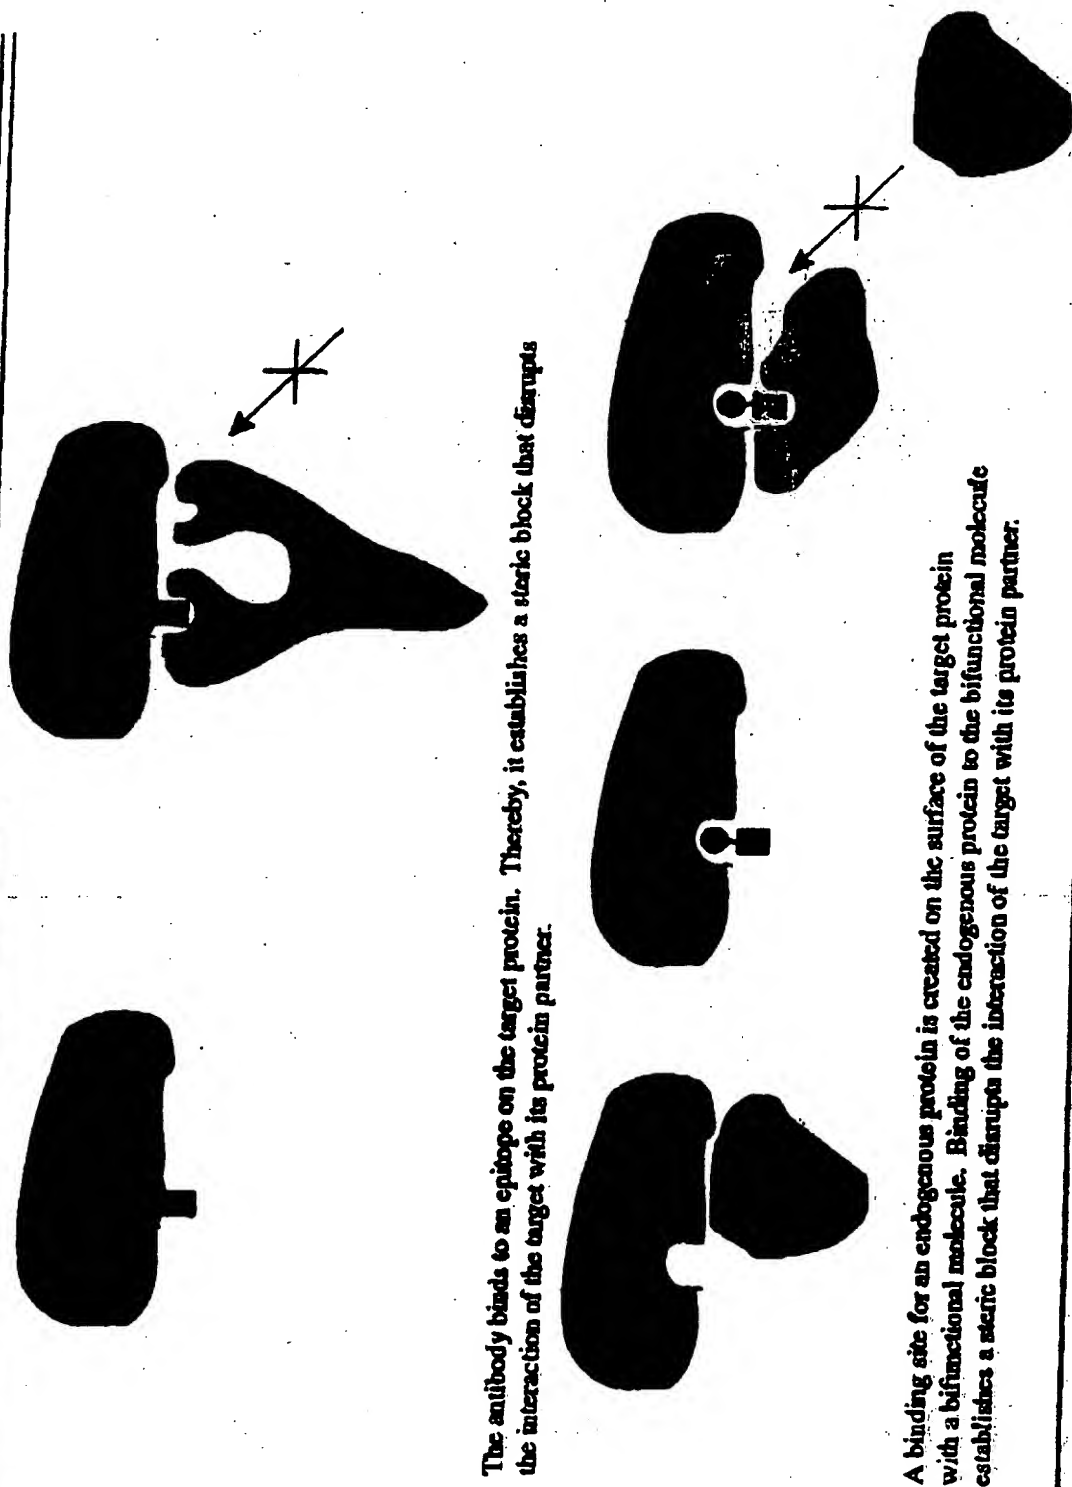

Fig 1

NFAT translocates into the nucleus after activation of calcineurin with ionomycin

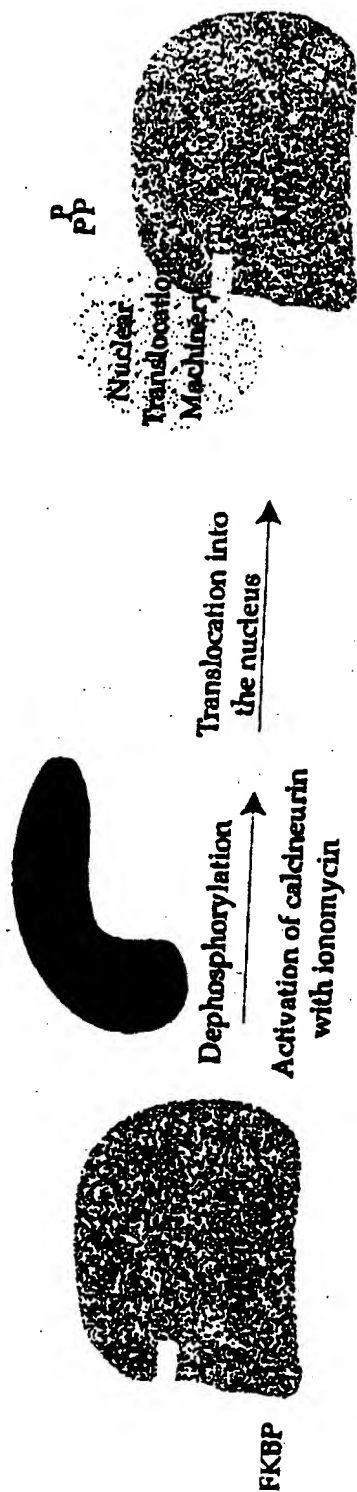

Fig 2

Binding of FRB to FKBP-NFAT with rapamycin abolishes translocation into the nucleus

COS cells transfected with FRB and FKBP-NFAT

Translocation of FKBP-NFAT into the nucleus [%]

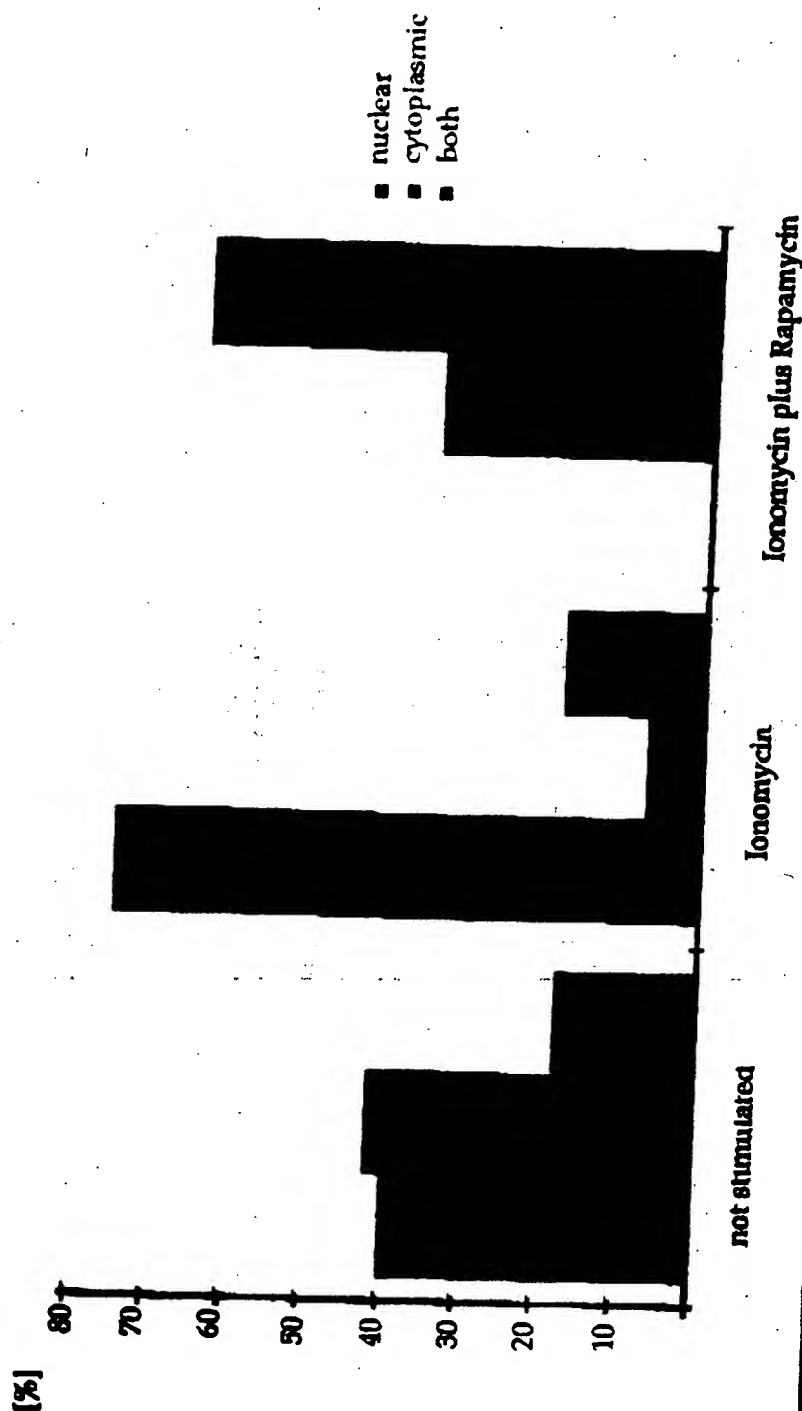

Fig 3

Steric blockage prevents access of regulatory proteins to NFAT

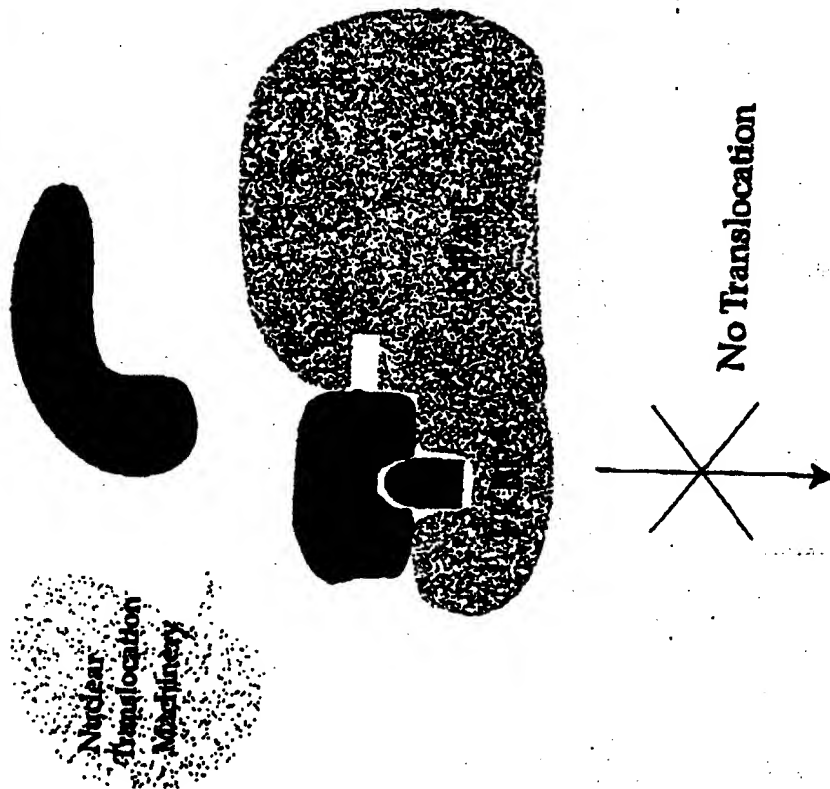

Fig 4
